

REED MAT (53 lbs.)

Four 60" Reed trunks, twenty-two 60" limbs

1. Insert all limbs in one trunk. Insert into outer "V" shapes and **angle tip down slightly** as you insert into V-shape directly across trunk. Leave 4" of limb through one side of trunk.
2. Lay trunk down on its side, with group of five limbs touching the ground and group of two limbs facing vertical.
3. Take second trunk and insert onto the group of two vertical limbs, starting with the V-shape on the bottom of trunk. Keep trunk as level as possible to ensure alignment of limb slots. Slide second trunk down within 20" of bottom trunk. Repeat for trunks three and four.

TIP: (1) Ensure tips of limbs are aligned to both limb slots.

(2) Manipulate the middle of the limb back and forth while putting downward pressure on the trunk.

4. Stand structure where the four trunks are parallel to the ground—five limbs should now be vertical. Insert all remaining limbs vertically leaving 4" of limb through one side of trunk. Structure should sit level and parallel to the ground.
5. **Product needs weighting.** We recommend two concrete blocks on opposite and opposing ends of middle two trunks. To weight structure, remove vertical limbs on the ends of the trunks at desired weighting location. Insert concrete blocks (not included) and re-insert vertical limbs, locking the blocks in place.
